Triphos Co., Ltd.

2026.02 ~ 2026.11

Web & Mobile Developer

Built business web applications and server APIs and integrated Android app features.

Selected work

Web / AI

2026.09 ~ 2026.10

AI-Powered Document and Data Analysis Platform

Migrated an existing Python system to Django and React, checked screen, API and data parity, and improved document search and answer evaluation.

Decisions and verification

Fix the evaluation targets and validate the verdicts — Fixed the target statements on the server for Ragas evaluation and matched the returned evaluation results by statement ID. Batched long inputs and checked quotations, supporting evidence, and answer coverage separately.

Verification · Completed evaluation of 25 claims extracted from an answer about a real document in five batches. Checks reject missing or duplicate IDs and invalid response types before malformed verdicts can be stored as valid results.

Separate model latency from application overhead — Profiled internal processing with fixed model responses, then removed repeated token counting and reused document pages already processed within the request.

Verification · After warmup, 20 runs before and after the change showed median internal processing fall from 2,969ms to 672ms. Model call counts stayed unchanged.

Outcome

Median document-analysis processing fell from 2,969ms → 672ms with fixed model responses and 20 runs per condition after warm-up. Evaluated 25 items from a live long answer in 5 batches and displayed the answer before evaluation finished.

Web / API / Android

2026.07 ~ 2026.10

Transport Settlement and Vehicle Management ERP and Mobile App

Built the transport settlement ERP and connected mobile business features, excluding the existing chat system, and prepared runtime and maintenance handover.

Decisions and verification

Block stale saves and let users resolve the differences — The server rejects outdated versions while the screen retains the draft. Users compare the original, latest server, and edited values, then confirm their choices through a separate save.

Verification · In development, a separate API request updated the record first. Confirmed that a browser save returning 409 preserved both the draft and the latest database values, then checked the resolved save against the database and change history.

Separate notification content from read receipts — Version and deletion checks prevent a late creation event from reviving a deleted notification. Read receipts are stored separately; a single UPSERT replaces an update-then-insert sequence while preserving the first seen time.

Verification · Reproduced a receipt deadlock in isolated MariaDB, then reran concurrent requests. Reversed and repeated notification events to verify that the latest content and receipt state were retained.

Outcome

Reproduced concurrent-edit conflicts in the development environment and verified draft retention, preservation of current data and an explicit save of selected values. Added Excel batch rollback, repeat-request handling and administrator work logs.

Web & Mobile Developer

Selected work

Web / Android

2026.04 ~ 2026.06

Contract-Customer Parcel Web and Shipping Label App

Built the complete logistics frontend and Android printing app, covering search, reservations, Excel imports, PC label printing and Bluetooth printer integration.

Decisions and verification

Use bundle analysis to find and split unnecessary startup code — Used bundle analysis to identify code that was not needed on entry. Loaded page code when users entered each screen and Excel libraries when they started an upload or download.

Verification · In a standard production build, initial JavaScript fell from 2,405.50kB to 616.60kB, or 815.10kB to 204.38kB with gzip. Checked that navigation, data queries, Excel operations, and PC label printing still worked after the change.

Trace the connection failure into the SDK — Device logs showed that the SDK stopped device discovery during connection. Because that operation also requires scan permission, the app now checks both scan and connection permissions.

Verification · Checked the permission prompt, printer connection, and physical label output on an Android 16 device.

Outcome

Reduced the initial JavaScript file from 2,405.50 kB to 616.60 kB, about 74%. Used physical PC and Android Bluetooth labels to correct differences between screen previews and printed output.

Additional work

Stock Auto-Investment and Account Management Web App

2026.02 ~ 2026.03

Built the complete React frontend against MSW mock APIs, including shared tables, filters and query and editing state.

School Transport and Attendance Management Platform

2026.09

Added member search, editing, duplicate merging, inquiries and attachments to existing web and Android apps. Checked member roles and authorship on the server and connected file selection and image previews in the app.

Parcel Pickup and Delivery Operations Platform

2026.08

Updated map-marker selection and return-to-map behavior. Retained delivery-completion requests and photos offline, restored requests after app restarts and compared them with completed server records before retrying.

Parcel Customer Website and Management Portal

2026.08

Updated an Excel-upload screen that labelled every failure as a timeout. Distinguished parsing, validation and communication errors, displayed the failed stage and elapsed time, and verified the changes locally.

Location-Based Daily Information App

2026.06 ~ 2026.07

Added weather, air quality and alerts through public APIs. Cached server responses by region and information type and displayed current weather and core forecasts first. Distinguished previous data from unavailable information after failed refreshes.

Chart Editor

2026.03 ~ 2026.04

Built chart settings, data connections and previews for a website under development. Connected chart-specific data fields and reduced unnecessary recreation to limit flicker and scroll movement.
